

Resiliency in Our Hearts

The main focus of the third session of Sea- Teacher- TVET Lecture Series, is about providing a shed of light amidst this pandemic times. This session gives me to give a reason for hope for agriculture. As of the moment that I listened to this lecture it gives me a springboard of doing my research as a vector for upbringing innovations that will contribute to my specialty and the needs of the country. Many spectacular projects have been said in these sessions and I have a feeling of amazement in the projects that were presented a while ago. I believed that all of this will be furnished and prosper to bring help in each boundary of the world. The lecture is giving importance in agriculture and May I refer to this quote that “Farming is a profession of hope.”, according to Brett Brian, I connected this short quote for these sessions because planting or farming is closely related to agriculture. as we plant we may have the feeling of fulfillment when we are the ones who planted it and we ensure that the plant will grow stout and strong and may live for life. We as a living organism, like the plants we should continue living for growth and developments, and the signs of success are by imploring the experiences, challenges, victories, and even the times of rough days. On this earth, we are needed to live and we should keep in mind that we need to survive and believe that there are more possibilities and reclaim the hope what we have a plan or take action. It is more likely that the topics are presented to us to keep the spirits, make a thought of positivity amidst these trying times.

The lectures keep reminding us of the deeper things in promulgating the subjects of science, engineering, mathematics, physics, and also the culture of the arts. I also added this because as a teacher and at the same time a researcher, we must think that these subjects are the craft of human interventions and upgrading us through the coming of generations after generations. It keeps us from learning in the continuum processes.

Lastly, all of the advancements or research are important that’s is why we need to embrace the new normal setting, I realized also that to innovate act as a plant, embrace the challenges and seek continual learning.
